WOODEN BUMPER BASE PROTECTION

Durable Construction and Purpose

Made from hard, tough wood and finished in our workshops, each bumper weighs around 75 kg and provides protection to guide wheel units at the front of the mobile bases.

Ease of Installation and Functional Design

Easy to fit, they provide a simple solution to prevent damaged wheel units and control boxes. It has been designed to protect the front wheel units against forklift and reach truck impact and is coated with a varnish or a stained coating.

To combat the effects of cracking, two cuts are made on the reverse side of the bumper to relieve the stresses in the wood, resulting in minimal cracking.

Should the bumpers in your store develop cracks before any impact occurs this would be considered normal. The wooden bumper after all is meant to take all the bumps and have the scars to prove it.

Aesthetic Appeal and Natural Wood Behaviour

They also enhance the Mobile Racking System with a clean, professional appearance. Occasionally, cracks appear in the bumper before any type of impact has occurred. This is normal as the wood, which has moisture in it, continues to dry out, even in a cold room.
